

MySQL Sandbox

<http://mysqlsandbox.net>

- Free software (GPL)
- One (unix) host
- Many database servers
- Single or multiple sandboxes
- Customized scripts to use the servers
- Standard or circular replication
- Installs IN SECONDS
- Installs (experimental with Gearman) to remote servers

Monday, 20 July 2009

MySQL Sandbox is a tool that installs an additional MySQL server in a few seconds. You can have more than one database servers in your host, all of them independent from each other. Installing a new server with MySQL Sandbox is a matter of seconds. You can install either a single sandbox or a system including multiple ones. Sandboxed servers can be stand-alone or related in standard or circular replication systems. It is free software, and it works on most every unix OS. In combination with Gearman, it can install and setup replication systems across multiple hosts.
